

Plant bare root trees and roses

1

DIG YOUR HOLE

Prepare your hole by digging an area that is 40 x 40 x 40cm. Place a shovel full of Grow Better Enriched Organic Planting Mix back into the base of the hole, with a generous handful of Grow Better Gypsum.

2

MIX THE SOIL

Combine the soil that has been removed from the hole with a bag of Grow Better Enriched Organic Planting Mix. Hammer a garden stake into the middle of the hole.

3

PLANTING YOUR TREE

Prune any broken or damaged roots or branches. Place tree in the hole and tie it to the stake, so that the graft is around 30mm above the soil. Fill the hole with the soil mix and lightly pack it down with your foot.

Once you pick up your trees, it is best to get them into the ground as soon as you can. If you have already prepared a place for them, the next steps will be a breeze!

4

MAKE A WELL

Make a small well around the base of the tree, making sure the roots are still covered with soil. Sprinkle a handful of Grow Better Organic Fertiliser around the base of the tree, in the well area.

5

WATER YOUR TREE

The day you plant your tree, water with a bucket or watering can mixed with some Grow Better Plant Starter. Continue to water your tree as required, ensuring you keep the soil moist at all times.
